

Hygienic Features That Make Aquafil Products Ideal for Healthy, Happy Communities

Team CIVIQ understand that communities trust us to deliver a hygienic user experience whether it be through interaction with our water bottle refill stations and drinking fountains, hand-washing stations or showers. We take our promise and commitment to helping create healthier, happier communities very seriously so place user experience and hygiene at the core of our product design.

External Drainage

Water flows away from the point of contact so no residue is left at the user interface eliminating any chance of algae, mildew or mould.

Silver-ion Antimicrobial Protection

Our units feature anti-bacterial bottle refill points and they have silver-impregnated plastic. But why silver? Silver metal has been valued for its ability to help keep food and water from going bad. Silver atoms can actually kill bacteria, fungi, moulds and even some viruses.

Backflow Prevention

Our units incorporate a backflow prevention system to reduce the chances of contamination to the main water source.

Mouth Guard

Our drinking fountains have different types of mouth guards, all of which are effective in eliminating direct mouth contact and contamination.

Left to Right Water Flow

The water flows to the left and to the right of user contact on our drinking water stations. This is unlike other drinking fountain designs where the water flows upwards and then comes back down into the drain which increases the risk of contaminated water sources.

Button Activation Placement

The button to activate the drinking fountain and bottle refill is found away from the bowl and refill point which prevents the user's hands from touching and contaminating the spout or refill point as they use the unit.

Touchless, Sensor Activation

Touchless, sensor activation options are available to provide an enhanced hygienic user experience.

Filter

We all know that access to clean, fresh water is fundamental to our health and wellbeing, and filtering our water ensures that this is achieved. Most water filters remove harmful chemicals and bacteria, which if consumed can cause diseases and general ill-health.

WaterMark Certified

Our commitment to safety and quality ensured we transitioned to brass free plumbing in all our water products which allow us to provide assurance to our clients that water coming through our fountains is lead-free and safe to drink. CIVIQ products meet the requirements of ASNZ4020 and WaterMark.

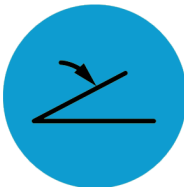

Food Grade Stainless Steel

Our units utilise food grade stainless steel with a further marine grade electro polish finish to resist tea staining, algae, mould and contamination on the drinking fountain bowl, bottle refill sides and nozzles.

Concealed Drainage

Concealed drainage to prevent the growth of mildew and mould and blockages from dirt and grime.

Foot Operated

Foot operated options are available to provide an enhanced hygienic user experience.
